Digital Literacy Project Report

Name: Mandar Parkhe

Registration No.: 25BCE10093

Branch: B.Tech (CSE-Core)

Year: First Year (2025-2026)

Course Code: CSA0001

Date: 28-03-2026

Project Report:

Digital Literacy Resource Design

For this task, I used **Canva** to design a one-page infographic titled "Digital Literacy for Students: Your Guide to Thriving Online." I chose this tool because of its intuitive drag-and-drop interface and its wide array of educational templates, which allowed me to create a professional-grade resource quickly and efficiently.

The design is organized into three distinct, color-coded sections to help my batchmates navigate the information easily. The first section defines **Digital Literacy**, moving beyond basic computer use to emphasize the critical thinking required to evaluate online sources. The second section focuses on **Safe Internet Practices**, providing high-impact tips on password security and phishing awareness. The final section covers **Email Etiquette**, using a visual "anatomy of an email" to demonstrate how to communicate professionally with professors and peers.

One thing I found particularly interesting during the design process was the challenge of **information hierarchy**. I initially had far too much text, but I realized that a visual resource is most effective when it uses icons and short, punchy bullet points. Learning how to balance white space with essential information was a valuable lesson in visual communication that I look forward to applying in future ambassador projects.

Project Report:

Integration Report

For this task, I have established profiles on **GitHub**, **LinkedIn**, and **Kaggle** to build a balanced professional and technical foundation. **GitHub** serves as a vital repository for version control, allowing me to host code and collaborate on software projects. **LinkedIn** acts as a professional networking hub, essential for tracking industry trends and connecting with mentors. **Kaggle** provides a specialized environment for data science and machine learning, offering access to complex datasets and global competitions.

Over the next four years, I plan to use these platforms to bridge the gap between academic theory and practical application. On GitHub, I will maintain a consistent "commit" history by documenting my lab assignments and personal projects, creating a transparent portfolio of my growth. I will leverage LinkedIn to build a strategic network, seeking out internships and staying informed about the skill sets currently in demand by top employers. Finally, I intend to use Kaggle to sharpen my analytical abilities, participating in community challenges to apply mathematical concepts to real-world data problems. Together, these platforms will serve as a digital resume that evolves alongside my technical expertise.

Project Report:

Awareness Task

For this project, I utilized **Google Forms** as the primary platform for quiz construction and data collection. To manage and analyze the data effectively, I linked the form to **Google Sheets**, which allowed for a real-time response view and structured data visualization. Finally, I used **GitHub** to host the project documentation, ensuring the README and task-specific directories were professionally organized.

I built a five-question diagnostic tool covering critical pillars of modern digital life: password security, phishing identification, the concept of a "digital footprint," fact-checking methodologies, and public network safety. Practicing with these tools involved configuring quiz logic, managing spreadsheet permissions, and implementing version control for the project files.

Academically, these tools are indispensable. Mastering **Google Forms and Sheets** streamlines the process of data collection for research projects and lab reports. Furthermore, maintaining a **GitHub** repository builds a professional digital portfolio, demonstrating technical proficiency in documentation and collaboration—skills that are essential for any student navigating a modern technical curriculum.

Project Report:

Professional Communication and Digital Etiquette

Date: March 28, 2026

Subject: Digital Communication Case Study and Best Practices

Status: Final Submission

---

1. Case Study: The Cost of Poor Digital Communication

In a collaborative software development project, a team lead once implemented a major architectural change to a Python script without notifying the group through a formal email or communication channel. They assumed the commit message on GitHub would suffice. However, because the update introduced new library dependencies that were not documented, the entire team's local environments crashed during a critical integration phase. This lack of direct, structured communication led to twelve hours of unnecessary troubleshooting and a missed project milestone.

Corrective Actions:

To prevent this, the lead should have followed professional etiquette by sending a concise "Action Required" email to the team. This message should have clearly outlined the technical changes, the new installation requirements, and the potential impact on the existing codebase. Utilizing a structured subject line and a bulleted list of changes would have ensured that the technical update was prioritized, maintaining project velocity and professional accountability.

---

2. Task-4 Deliverables Summary

As part of this module on digital professionalization, the following documents have been prepared to ensure clear and effective academic and professional outreach.

Document Checklist

File Name	Description	Status
`extension_re`	A formal emai professor requ deadline exten	Completed
`internship_`	A proactive en coordinator re summer oppor	Completed
`social-mediacheckli`	A 10-point gui maintaining a digital footprin	Completed

---

3. Implementation Guide

Note: All email templates follow the **SCRE** (Subject, Context, Request, Expected Outcome) framework to ensure clarity and professional tone. The social media checklist has been placed in the `task-4-emailetiquette/` directory to serve as a persistent reference for future career branding.

Project Report:

Cybercrime
Prevention and Digital Safety

Date: March 28, 2026

Subject: Task 5 - Cybercrime Analysis and Prevention

Status: Final Submission

---

1. Research Reflection: The Reality of Digital Vulnerability

What surprised me most during this research was the sophisticated psychological engineering behind UPI fraud. I previously assumed cybercrime mostly involved complex hacking or "cracking" of systems; however, the majority of modern financial crimes in India exploit simple human trust and a misunderstanding of interface design (such as the "Collect Request" feature). It is sobering to realize that even technically literate engineering students can be caught off guard by high-pressure social engineering.

As a result of this study, the one habit I will personally change is my approach to app permissions and public connectivity. I will move away from the convenience of "staying logged in" on all platforms and implement a strict "Clean Wi-Fi Only" rule for accessing my student portal and bank accounts. Additionally, I will commit to a monthly audit of my background app activities to ensure no "ghost" processes are compromising my device performance or data privacy.

---

2. Stay Safe Online: Prevention Checklist

This checklist is designed for quick reference and has been saved to the project directory for ongoing use.

- **UPI PIN Discipline:** Never enter your UPI PIN to *receive* money. If a "buyer" or "agent" asks you to scan a QR code and enter a PIN to get a refund or payment, it is 100% a scam.
- **Verify the Receiver:** Always double-check the verified name that appears on your screen after scanning a QR code before hitting 'Pay'. Scammers often use names that mimic official entities.
- **Hardware Hygiene:** If your laptop or phone is running hot or the battery is draining faster than usual, check for unauthorized background apps. Avoid downloading "cracked" software for engineering assignments as they often contain keyloggers.
- **App Permission Audit:** Review your settings and revoke "Always On" location and contact access for apps that don't strictly require them for their core function.
- **Two-Factor Authentication (2FA):** Move beyond SMS-based OTPs where possible. Use an authenticator app for your GitHub, LinkedIn, and Email accounts to prevent account takeovers.
- **Social Media Privacy:** Keep your profiles private and avoid sharing "live" locations or photos of your admit cards/IDs, as these provide enough data for identity theft.
- **Link Skepticism:** Treat every "KYC Update" or "Job Offer" SMS containing a link as a threat. Official organizations rarely ask for sensitive updates via bit.ly or shortened URLs.
- **Secure Networking:** Use a VPN if you must use campus or cafe Wi-Fi for academic work, and never perform financial transactions on these open networks.
